Deploying to Cloud Run

Ship a container in 90 seconds

Why it matters

Scales to zero

- No idle cost when nobody is calling it
- No cluster to patch
- No YAML to write

One command

- Point it at a directory
- Cloud Build does the container

```
gcloud run deploy my-service --source .
```

The long list

- one
- two
- three
- four
- five
- six

The long list (cont.)

- seven
- eight

Wrap up
